New Features

Pop-up Windows

Supports small windows for fast data input or preview without leaving the main page.

Integration with Online File Storage

Enables integration with online file storage services, such as SharePoint, Azure Files, Azure Blob, to facilitate document exchange and storage outside the portal.

Security Dashboard

A security analytics dashboard that identifies pages with missing public access restrictions or improperly configured data filters, providing insights into vulnerabilities and helping administrators mitigate security risks.

Data Retention Tools

A feature for controlling how long specific data is retained and how it is deleted or archived, applicable to transactional data, files, and logs.

Decoupled Data Index Deployment

This enables independent deployment of the data index and the portal website in cloud environments, enhancing flexibility and deployment options.

Translation Management Tool

Introducing a translation tool that enables seamless export of portal content into a structured translation file, allowing translations to be populated and re-imported effortlessly, thus accelerating multi-language rollout.

AI Assistant

An AI-powered assistant that enables users to query order statuses, identify delayed or stagnant orders, and receive concise, context-aware summaries through natural language search.

Record Copying

Enables configurable copy actions that allow users to duplicate selected records within the same entity or copy into other entities. This feature simplifies data entry and reuse by allowing records to be copied directly via a dedicated action button.

Wizard Pages

A functionality that guides portal members through step-by-step forms to simplify the creation and submission of requests, orders, and documents.

Data Batch Update

A feature to streamline data management by enabling efficient bulk updates for multiple entries within the portal's data index.

Quick Views

Allows adding preconfigured views to quickly apply filters. Personalized views remain available alongside these quick views.

CMS Page Locking

Allows checking out pages in the CMS and blocking them from being edited by other users.

Integration with Payment Service

Introduces seamless payment processing by integrating a trusted online payment service, enabling smooth in-portal transactions.

Progress Indicator

Provides a visual progress bar that displays the current stage and overall progression of a record through defined process phases. This helps users quickly understand status, remaining steps, and where they are in the process at a glance.

Subscription & License Management

Allows administrators to request license purchases or updates directly from within the CMS, eliminating the need for manual communication and uploads.

AI Assisted Translation Tool

Enables configurators to send the translation file directly to an AI service and receive a fully populated Excel file with suggestions. Speeds up localization while allowing review and adjustments before import.

Integration with Tracking Service

Adds real-time shipment tracking capabilities directly within the portal, allowing users to monitor delivery statuses easily.

E-Commerce Style Ordering Experience

Introduces a B2C-style ordering experience, including add-to-cart functionality and a checkout process, making the portal feel more like a familiar e-commerce environment.

Service Order Management (new module)

Introduces a dedicated module for capturing and managing service requests, allowing users to register service orders with clear indications of failures, issues, or symptoms. This module streamlines service intake and provides a structured foundation for service processing and follow-up.

AI-Assisted Configuration Tool

Enables page configuration using natural-language prompts, allowing configurators to describe the desired page structure and behavior instead of manually setting each element. The tool translates prompts into ready-to-use page configurations, accelerating setup while keeping full control over the final result.

Improvements

Simplified Notification Subscription Management

Updated default pages to improve usability and user-friendliness for business users, while retaining advanced notification management for administrators.

Miscellaneous UI/UX Features

Improvements such as page space usage optimization, expand/collapse smoothness, sizeable commands, quantity stepper, text-like look for non-editable fields, etc.

GDPR – Cookies Management Extension

Provides users with a user-friendly way to manage their cookie preferences, including the ability to change those preferences later.

Mobile and Tablet UI

Optimized portal components for mobile and tablet use, with device-specific layouts applied automatically based on the device.

Bundled Notifications

A functionality that allows receiving notifications at set intervals, sending a single summary email with all changes during that period. This helps keep user mailboxes cleaner when updates are frequent.

Inline Record Actions

Allows commands to be placed directly on records in tile view, enabling users to perform actions without navigating to the command toolbar. This improves efficiency by making frequently used actions immediately accessible in context.

Revised Permission Management

Streamlines the process of assigning permissions, improving clarity, access control, and visibility.

Enhanced Logging

Unifies existing logging into a centralized, performance-optimized solution to improve clarity, completeness, and usability of logs.

Platform

Umbraco Update

Upgrade to Long-term Support version of Umbraco 13.11.0 to ensure platform stability.

Umbraco Update

Upgrade to Long term Support version of Umbraco 17 to ensure platform stability.
